(54) Title: Ca, Mg AND Ni CONTAINING ALLOYS, METHOD FOR PREPARING THE SAME AND USE THEREOF FOR GAS PHASE HYDROGEN STORAGE

(57) Abstract: Disclosed are new Ca, Mg and Ni-containing alloys of the general formula:  $(Ca_x Mg_y M_z)_b (Ni_{1-z} T_1)_a$  where: M is at least one metal selected from the group consisting of Y, Ce, La, Pr, Nd, Th, Ti, V, Zr, Ta, Hf, Sr, Ba and Misch metals; T is at least one element selected from the group consisting of Al, Zn, Cu, Fe, Co, Mn, Cr, Mo, W, Si, Ga, Ge, In, Sn, Ag, C and B; a is an integer equal to 2 or 5; z is a number ranging from 0 to 0.5; when a is equal to 2, then  $0.9 \leq b \leq 1.1$ ; and when a is equal to 5, then either  $1.75 \leq b \leq 2.25$  or  $0.75 \leq b \leq 1.31$ . These alloys which are of the  $AB_2$ ,  $A_2B_5$  or  $AB_5$  types, may be single phase or multiphase and are useful for reversibly absorbing hydrogen from a gas phase. Also disclosed is a method for preparing the above alloys.

WO 03/072838 A1

**Ca, Mg AND Ni CONTAINING ALLOYS, METHOD FOR PREPARING THE  
SAME AND USE THEREOF FOR GAS PHASE HYDROGEN STORAGE**

5

**Field of the invention**

The present invention is directed to Ca, Mg and Ni-containing alloys. It is also directed to a method for preparing these alloys and to their use for reversibly absorbing hydrogen from a gas phase.

10

**Background of the Invention**

The use of hydrogen gas as a fuel for PEM fuel cells has received considerable attention in recent years because PEM fuel cells using pure hydrogen can provide high efficiency and ultra clean power. Unfortunately, widespread use of hydrogen energy is not currently feasible because of economic and technological barriers. One of the important barriers is the lack of cost effective, safe hydrogen storage method.

20

Hydrogen gas is very light. It can be compressed under high pressure and stored in pressurized vessels. It can also be liquefied and stored in liquid form. Hydrogen also reacts with metal or non-metals to form hydrides. Some metal hydrides called "low temperature metal hydrides" are reversible at ambient temperature and pressure. From a safety point of view, metal hydrides are intrinsically safe since the hydrogen must be released from the hydrides before it can burn or be oxidized. The volumetric density of hydrogen storage in metal hydrides is usually high.

25

The most serious shortcomings of the reversible metal hydrides and more particularly the low temperature metal hydrides are their low gravimetric

30

storage density and the high cost. For stationary and some mobile applications, the weight of the hydrogen storage tank is not a problem. However, the high cost of conventional low temperature metal hydrides results in too expensive storage devices.

5

Amongst the known hydrogen storage materials, conventional lanthanum or mischmetal-based alloys of the AB<sub>5</sub> type like LaNi<sub>5</sub> alloys are inherently expensive because they make use of a rare earth metal. CaNi<sub>5</sub> is isomorphic to LaNi<sub>5</sub> and has higher storage capacity than that of LaNi<sub>5</sub> based hydrides.

10 In the Ca-Ni system, there are four stable compounds, CaNi<sub>2</sub>, CaNi<sub>3</sub>, Ca<sub>2</sub>Ni<sub>7</sub> and CaNi<sub>5</sub>, but only the CaNi<sub>5</sub> has been considered to be of practical interest since the plateau pressures of CaNi<sub>5</sub> are adequate for applications. The other three compounds do form very stable hydrides. However, hydrogen can not be extracted at temperatures below 100°C under normal pressure.

15

In a paper published in 1980 (and identified A in the attached list of references), Osterreicher et al disclosed a Ca<sub>0.5</sub>Mg<sub>0.5</sub>Ni<sub>2</sub> alloy prepared by liquid sintering in a Ta tube. They also disclosed that such a Ca<sub>0.5</sub>Mg<sub>0.5</sub>Ni<sub>2</sub> alloy can absorb hydrogen to form Ca<sub>0.5</sub>Mg<sub>0.5</sub>Ni<sub>2</sub>H<sub>2.6</sub> at 300°K  
20 (corresponding to 1.7 wt.%). However, this hydride can only desorbs partially (half of the amount absorbed) at 400°K and 1bar. The desorption isotherm is strongly sloped. According to these authors, the low reversibility of this alloy limits practical applications. However, this publication teaches that substitution of Ca by Mg in CaNi<sub>2</sub> is possible. The alloys of the type  
25 Ca<sub>x</sub>Mg<sub>1-x</sub>Ni<sub>2</sub> are predominantly of CaNi<sub>2</sub> structure (C15 type) when x is larger or equal to 0.5.

In a recent paper (B) Terashita et al. disclosed a Ca<sub>x</sub>Mg<sub>1-x</sub>Ni<sub>2</sub> system. Moreover, they presented results of tests made on a Ca<sub>0.33</sub>Mg<sub>0.67</sub>Ni<sub>2</sub> alloy  
30 prepared by high frequency induction melting. Once again, the plateau pressure of this alloy Ca<sub>0.33</sub>Mg<sub>0.67</sub>Ni<sub>2</sub> is still too low for most gas phase

applications and it is impossible to raise the plateau pressure by substituting more Mg for Ca using the induction melt casting method because the  $\text{MgNi}_2$  phase precipitates. That phase is known for not absorbing hydrogen and consequently the properties deteriorate.

5

Since Ca and Mg have very high evaporation rate, it is very hard to produce a stoichiometric Ca-Mg-Ni alloy in large quantity. For example, if use is made of a melt casting method, the Mg and Ca alloy in liquid form has to be protected by argon or  $\text{SF}_6$  because of the rapid oxidization and possible explosion. The composition has to be adjusted by trial and error due to evaporation loss of Mg and Ca. The so-cast alloys usually have very high macro-segregation and micro-segregation. Homogenization by long annealing treatments is required but adds costs to the alloys. In paper A, the Ca-Mg-Ni alloys were synthesized by liquid phase sintering in closed Ta tubes starting from elemental Mg, Ca and Ni at a temperature below  $1250^\circ\text{C}$ . Such a method also needs high temperature and long sintering time to reach complete reaction.

Mg-Ca-Ni alloys of the  $\text{AB}_3$  type have also been synthesized by a powder sintering method. In a recent publication (C), Kadir et al disclosed a  $\text{CaMg}_2\text{Ni}_9$  ternary alloy prepared by sintering fine powder mixtures of  $\text{MgNi}_2$  and  $\text{CaNi}_5$ . This paper states that the sintering process involved raising the temperature stepwise to  $600^\circ\text{C}$ ,  $850^\circ\text{C}$  and  $990^\circ\text{C}$  (in 0.6MPa Ar gas), with set temperature holds for 2-3h. Several attempts were necessary until an optimum composition was found. A slight excess of  $\text{CaNi}_5$  over the stoichiometric composition was necessary in order to compensate for the evaporative loss of Ca.

Mg and Ca are known to react with all type of ceramic crucible at elevated temperatures and Ni is known to react with refractive metals at high temperatures. Therefore, all the sintering of alloys containing Mg, Ca and

Ni were performed so far in Mo or Ta crucible, especially when long sintering times were needed. In practice, this means that the use of this technology would be expensive.

## 5 Summary of the invention

The present invention as claimed hereinafter relates to new Ca, Mg and Ni-containing alloys of the general formula:

where:

M is at least one metal selected from the group consisting of Y, Ce, La,  
15 Pr, Nd, Th, Nd, Ti, V, Zr, Ta, Hf, Sr, Ba and Misch metals;

T is at least one element selected from the group consisting of Al, Zn, Cu, Fe, Co, Mn, Cr, Mo, W, Si, Ga, Ge, In, Sn, Ag, C and B;

a is an integer equal to 2 or 5

z is a number ranging from 0 to 0.5, and

20 when a is equal to 2, then b, c, d, e are numbers selected so that:

$$0.9 \leq b \leq 1.1$$

$$c = 0.4 - x,$$

$$d = 0.6 - y, \text{ and}$$

$$e = x + y, \text{ with}$$

25  $-0.4 < y \leq 0.5$

$$-0.5 \leq x < 0.4, \text{ and}$$

$$x + y > 0;$$

when a is equal to 5, then b, c, d, e, are numbers selected so that

either

30  $1.75 \leq b \leq 2.25$

$$c = 0.4 - x,$$

$$d = 0.6 - y, \text{ and}$$

- $e = x + y$ , with  
 $-0.4 \leq x \leq 0.2$ ,  
 $-0.2 \leq y \leq 0.4$ , and  
 $x + y \geq 0$
- 5 or  $0.75 \leq b \leq 1.31$ ,  
 $c = 0.6 - y$ ,  
 $d = x + y$ , and  
 $e = 0.4 - x$ , with  
 $-0.6 < x < 0.4$ ,  
10  $-0.4 < y < 0.6$ , and  
 $0 < x + y \leq 0.5$

When  $a$  is equal to 2, the alloys according to the invention can be said to be of the  $AB_2$  type.

15

When  $a$  is equal to 5 and  $b$  is ranging between 1.75 and 2.25, the alloys according to the invention can be said to be of the  $A_2B_5$  type.

When  $a$  is equal to 5 and  $b$  is ranging between 0.75 and 1.31, the alloys  
20 according to the invention can be said to be of the  $AB_5$  type.

In all cases, the alloys may be single phase or multiphase.

The invention also relates to a method for preparing the above mentioned  
25 alloys, comprising the steps of:

- milling a mixture of elemental powders and/or pre-alloyed combination of elemental powders of Ca, Mg, M, Ni and T in relative amounts corresponding to those found in the requested alloy; and
- annealing and/or sintering the so-milled mixture of powders at a  
30 temperature higher than  $800^\circ\text{C}$  to obtain the requested alloy.

The invention further relates to the use of the above-mentioned alloys for reversibly absorbing hydrogen from a gas phase.

- 5 The invention and its advantages will be better understood upon reading the following non-restrictive description and examples made with reference to the accompanying drawings.

**Brief description of the drawings**

10

With respect to the alloys of the  $AB_2$  type:

Fig. 1-1 shows the XRD (x-ray diffraction) spectra of a sample of composition  $Ca_{0.4}Mg_{0.6}Ni_2$  made by milling a powder mixture of Ca, Mg and Ni powders as a function of milling time.

Fig.1-2 shows the XRD spectra of a series of  $Ca_xMg_{1-x}Ni_2$  samples for  $x=0, 0.2, 0.4, 0.5, 0.7$  and  $1$  obtained after 20h of milling.

Fig.1-3 shows the XRD spectra of a mechanically alloyed  $Ca_{0.3}Mg_{0.7}Ni_2$  sample annealed for 1 hour at different temperature  $600^\circ C, 800^\circ C$  and  $1000^\circ C$ .

Fig.1-4 shows the XRD spectra of mechanically alloyed  $Ca_xMg_{1-x}Ni_2$  for  $x=0, 0.2, 0.3, 0.4$  and  $0.8$  after 1h annealing at  $1000^\circ C$ .

Fig.1-5 shows PCT (pressure-concentration isotherm) of  $Ca_xMg_{1-x}Ni_2$  alloys measured at  $30^\circ C$ .

Fig.1-6 shows the XRD spectra of Zn (on the B site) and Mm (on the A site) substituted  $Ca_{0.4}Mg_{0.6}Ni_2$  alloy after annealing at  $1000^\circ C$  for 1h.

Fig.1-7 shows the XRD spectra of Cu and Fe (on the B site) and Mm (on the A site) substituted  $Ca_{0.3}Mg_{0.7}Ni_2$  alloy after annealing at  $1000^\circ C$  for 1h.

Fig.1-8 shows the PCT of various  $(Ca_{0.4-x}Mg_{0.6-y}Mm_{x+y})Ni_2$  substituted alloys.

Fig.1-9 shows the position of the plateau pressures versus the lattice parameters for various  $Ca_xMg_{1-x}Ni_2$  alloys and  $(Ca_xMg_{0.7}Mm_y)Ni_2$ . The

substitution of Ca by Mm does not change much the lattice parameter but increases significantly the plateau pressures.

With respect to the alloys of the  $A_2B_5$  type:

5

Fig.II-1 shows the XRD spectra of  $(Ca_{0.4}Mg_{0.6})_2Ni_5$  after ball milling for various time using process A (i.e. starting with a mixture of intermetallics and elemental powders).

Fig.II-2 shows the XRD spectra of  $(Ca_{0.4}Mg_{0.6})_bNi_5$  for various  $A/B=b/5$  ratios after annealing at  $1000^\circ C$ .

Fig.II-3 shows the XRD spectra of  $(Ca_{0.375}Mg_{0.625})_2Ni_5$  made by process B (i.e. by milling elemental powder of Ca, Mg and Ni) and annealed 1h at various temperature.

Fig.II-4 shows the PCT curves measured at  $30^\circ C$  of  $(Ca_{0.375}Mg_{0.625})_2Ni_5$  annealed at various temperatures.

Fig.II-5 shows the PCT curves of  $(Ca_{0.375}Mg_{0.625})_2Ni_5$  annealed at  $1000^\circ C$  and measured at various temperatures.

Fig.II-6 shows the XRD spectra of various  $(Ca_xMg_y)_2Ni_5$  with various Mg/Ca ratios.

Fig.II-7 shows the PCT curves measured at  $30^\circ C$  of the various samples shown in Fig.II-5.

Fig. II-8 shows the XRD spectra of various Mm substituted  $(Ca_{0.375-x}Mg_{0.625-y}Mm_{x+y})_2Ni_5$  – Substitution on the A site.

Fig.II-9 shows the PCT curves of the various substituted alloys shown in Fig.II-8.

Fig.II-10 shows the XRD spectra of  $(Ca_{0.5}Mg_{0.375}Mm_{0.125})_2Ni_5$  and its hydride.

Fig.II-11 shows the XRD spectra of various  $A_2B_5$  type alloys with substitution on the B site.

Fig.II-12 shows the PCT curves of various substituted alloys shown in

Fig.II-11.

With respect to the alloys of the AB<sub>5</sub> type:

Fig.III-1 shows the XRD spectra of Ca<sub>x</sub>Mm<sub>1-x</sub>Ni<sub>5</sub> alloys made by mechanical alloying followed by annealing

5 Fig.III-2 shows the lattice parameters of the Ca<sub>x</sub>Mm<sub>1-x</sub>Ni<sub>5</sub> alloys shown in Fig.III-1.

Fig. III-3 shows representative PCT curves of some of the ternary Ca<sub>x</sub>Mm<sub>1-x</sub>Ni<sub>5</sub> alloys shown in Fig.III-1.

Fig.III-4 a&b show XRD spectra of ball milled Ca-Mg-Ni ternary alloys before  
10 and after annealing treatment and demonstrate that the solubility of Mg in CaNi<sub>5</sub> is very low.

Fig.III-5 a&b show XRD spectra of ball milled Mm-Mg-Ni ternary alloys before and after annealing treatment and demonstrate that the solubility of Mg in MmNi<sub>5</sub> is also very low.

15 Fig.III-6 shows XRD spectra of various mechanically alloyed Mm-Ca-Mg-Ni quaternary alloys before annealing treatment.

Fig.III-7 shows XRD spectra of various mechanically alloyed Mm-Ca-Mg-Ni quaternary alloys after annealing treatment.

Fig.III-8 shows the PCT curves of the quaternary alloys shown in Fig.III-7

20 Fig.III-9 a&b shows the XRD spectra of various Mm-rich quaternary Mm-Ca-Mg-Ni alloys (a) and the corresponding PCT curves (b).

Fig.III-10 a&b show the XRD spectra of various Mm-poor quaternary Mm-Ca-Mg-Ni alloys (a) and the corresponding PCT curves (b).

Fig.III-11 shows the relationship between the plateau pressure and the c/a  
25 parameter of various (Mm-Ca-Mg)<sub>5</sub>Ni<sub>5</sub> alloys.

Detailed description of the invention1. ALLOYS OF THE AB<sub>2</sub> TYPE

- 5 As aforesaid, when a is equal to 2, then the alloys according to the invention are of the formula:

- 10 where M and T are defined as above and

$$0.9 \leq b \leq 1.1,$$

$$-0.5 \leq x \leq 0.4,$$

$$-0.4 < y \leq 0.5,$$

$$x + y > 0; \text{ and}$$

- 15  $0 \leq z \leq 0.5.$

Preferably:

$$-0.1 \leq x \leq 0.25; \text{ and}$$

- 20  $-0.1 \leq y \leq 0.15.$

These alloys are single or multiphase hydrogen storage compounds of the AB<sub>2</sub> type, which are capable of absorbing and desorbing hydrogen from a gas phase at ambient temperature with a flat plateau pressure and a storage  
25 capacity larger than 1.2 wt %.

These alloys may be prepared by a method comprising the following two steps.

The first one consists of preparing a powder by milling a mixture of  
30 elemental powders and/or pre-alloyed combination of the elemental powders (ex.: Ca, Mg, Ni, Mm, CaNi<sub>2</sub>, MgNi<sub>2</sub>, MmNi<sub>5</sub>, when M = Mm) in respective

amounts selected to obtain the requested alloy. The milling can be a conventional ball milling or a more intensive mechanical alloying that can be carried out at room temperature or at high temperatures with or without anti-sticking agents and in various kind of atmosphere.

- 5 The second step consists of annealing and/or sintering the milled powder at elevated temperatures in a crucible made of, for example, stainless steel, for a short period of time in an inert or reactive atmosphere. This is an essential step to achieve a high reversible absorption capacity and a flat plateau. The annealing temperature should be higher than 800°C but not higher than  
10 1050°C.

The invention is based on the discovery that the mechanical alloying of elemental powders (such as powders of Ca, Mg, Ni) and/or of mixtures of intermetallic compounds (such as powders of  $\text{CaNi}_5$ ,  $\text{MgNi}_2$ ) corresponding  
15 to the composition of the formula:

leads to a nanocrystalline ternary intermetallic compound with the  $\text{CaNi}_2$   
20 structure (C15-type) for  $x \geq 0.3$ . This so-milled nanocrystalline alloy can reversibly absorb and desorb hydrogen at room temperature. However, the reversible absorption capacity is small and the slope of the PCT curves is very big like in the case of conventional large-grain polycrystalline  $\text{Ca}_x\text{Mg}_{1-x}\text{Ni}_2$  alloys already reported in the art (see reference B).

25

The invention is also based on the discovery that, when a thermal treatment of the present invention is applied to this mechanically alloyed powder, a substantial improvement in properties is achieved. Indeed, the hydrogen storage properties of the mechanically alloyed Mg-Ca-Ni are  
30 substantially improved by annealing the powder at temperatures higher than 800°C for short period of time, typically at 1000°C or slightly higher, for

0.5h to 1h. Annealing at temperatures lower than 800°C does not improve the hydrogen storage properties very much.

The ball milling time can vary from a few minutes to several hours. When  
5 the milling time is of about 10 hours, then a true alloy is formed between the components (see Fig.I-1), i.e. a nanocrystalline ternary intermetallic compound with the  $\text{CaNi}_2$  structure (C15-type)). Thus, in that case, the ball milling step is a mechanical alloying. Under these conditions, the post-thermal step becomes an annealing treatment which could be as short as  
10 0.5 to 1 hour as indicated above.

On the other hand, when the ball milling step is only carried out for a few minutes, the powder particles are then only agglomerates of the various constituents. In that case, the post-thermal step is a sintering treatment  
15 which could take a few hours to produce the final alloy product.

Further improvements to these alloys may be achieved by adding other elements to Ca, Mg and Ni or their combinations. Such an addition may raise the plateau pressure and improve hydrogen storage properties such as  
20 plateau slope and the long-term stability while keeping the  $\text{AB}_2$  (C15-type) structure as the main phase.

Example I-1: Compound according to the prior art made by the method according to the invention

25

$\text{Ca}_{0.3}\text{Mg}_{0.7}\text{Ni}_2$  ( $b = 1$ ,  $x = 0.1$ ,  $y = -0.1$ ,  $z = 0$ ) was synthesized in a SPEX® high energy ball mill under the protection of argon. A Mg powder (>99%, + 100mesh), Ca granules (>99.5, ~2mm in size) and a Ni powder (<99.9%, -325mesh) were used as starting materials.

30

Isothermal annealing was performed in a tubular furnace under the protection of argon flow. The mechanically alloyed powder was sealed in a stainless steel crucible before annealing. The powder was heated to 1000°C at a heating rate of 30C/min, and held at 1000°C for 1 hour, then  
5 cooled down to room temperature in the furnace.

Hydrogen absorption/desorption properties were measured by using an automatic Sievert's type apparatus. The annealed powder normally needs mild activation treatment, such as heated to 200°C under vacuum and then  
10 cooled down. EDX analysis shows that the Fe content in the end product less than 0.2 at.%. The composition of the end product was close to the nominal composition. The activated alloy exhibited a relatively flat plateau and a high capacity.

15 Example I-2: Compound according to the invention made by the method according to the invention

$\text{Ca}_{0.15}\text{Mg}_{0.7}\text{Mm}_{0.15}\text{Ni}_2$  ( $x = 0.25$ ,  $y = -0.1$ ,  $M = \text{Mm}$ ,  $x + y = 0.15$ ,  $b = 1$ ,  $z = 0$ ) was synthesized by mechanical alloying of elemental powder blends. The  
20 alloy was annealed in the same manner as in Example 1. This alloy had a hydrogen storage capacity of 1.25wt.%. The plateau pressure was drastically raised, and the plateau slope was much less than that of  $\text{Ca}_{0.3}\text{Mg}_{0.7}\text{Ni}_2$  of the example I-1

25 Examples I-3 and subsequent

Other examples similar to example 1-2 were carried out. The results of these other examples are reported in the accompanying drawings (see Figs. I-1 to 9).

## 2. ALLOYS OF THE A<sub>2</sub>B<sub>5</sub> TYPE

As aforesaid, when a is equal to 5, then the alloys according to the invention may be of the formula:

5

where M and T are defined as above and

10  $1.75 \leq b \leq 2.25$ ,  
 $-0.4 \leq x \leq 0.2$ ,  
 $-0.2 \leq y \leq 0.4$ ,  
 $x + y \geq 0$ , and  
 $0 \leq z \leq 0.5$ .

15

Preferably:

$-0.1 \leq x \leq 0.1$ , and  
 $-0.1 \leq y \leq 0.2$ .

20

Preferably also, Mg and Ca are present in a Mg/Ca ratio ranging from 0.5 to 2 and more preferably from 1.5 to 1.75.

As mentioned before, in a Ca-Ni system, there are four stable compounds CaNi<sub>2</sub>, CaNi<sub>3</sub>, Ca<sub>2</sub>Ni<sub>7</sub> and CaNi<sub>5</sub>. The CaNi<sub>2</sub> -type system (also called AB<sub>2</sub>)  
 25 has been the subject of PART I hereinabove. This system has a cubic C15 structure and Mg can substitute Ca up to  $x = 0.3$  in the Ca<sub>x</sub>Mg<sub>1-x</sub>Ni<sub>2</sub> alloys while maintaining a cubic structure. The unit cell volume decreases and the plateau pressure increases with increasing the Mg content.

30 In accordance with the invention, it has been found that the replacement of Ca and/or Mg by Mm in a quaternary AB<sub>2</sub> type Ca-Mg-Mm-Ni system improves the hydrogen storage properties significantly

CaNi<sub>3</sub> type alloys have been investigated in great details. The intermetallic  
 35 compound CaNi<sub>3</sub> can absorb hydrogen readily to form CaNi<sub>3</sub>H<sub>4.5</sub> but cannot

release hydrogen under ambient conditions (see reference A). Oesterreicher et al. have investigated the pseudo-binary  $\text{Ca}_x\text{Mg}_{1-x}\text{Ni}_3$  and found that Mg can substitute Ca up to  $x = 0.7$  (see again reference A). Recently, Kadir et al. reported a series of  $\text{AB}_3$  alloys of the type  $\text{AB}_2\text{C}_9$  identified as  $\text{RMg}_2\text{Ni}_9$  where (R = La, Ce, Pr, Nd, Sm and Gd) (reference D) and a  $\text{CaMg}_2\text{Ni}_9$  alloy (reference C) synthesized by sintering a mixture of elemental powders or intermetallic compounds. They found that these  $\text{AB}_2\text{C}_9$  type compounds have the  $\text{PuNi}_3$  structure (reference D). The unit cell volume and hydrogen storage properties can be altered by different substitutions for the A, B and C elements.

In between  $\text{CaNi}_2$  and  $\text{CaNi}_3$ , a metastable  $\text{Ca}_2\text{Ni}_5$  compound with an hexagonal  $\text{P6}_3/\text{m}$  structure (space group 176) has previously been reported (see reference E). This material was prepared from the melt by a peritectic reaction at  $1035^\circ\text{C}$ . The present inventors have not been able to synthesize this compound by using the method of preparation described in this document but have discovered that when one substitutes some Ca by Mg in the virtual  $\text{Ca}_2\text{Ni}_5$  compound, a new phase having a structure different from those of  $\text{AB}_2$  ( $\text{MgCu}_2$  – cubic),  $\text{AB}_3$  ( $\text{PuNi}_3$  – hexagonal) and  $\text{Ca}_2\text{Ni}_5$  ( $\text{BaC}_6$  – hexagonal) is formed when the compound is prepared by the method of the present invention. This new phase has a large hydrogen storage capacity and an adequate plateau pressure for reversibly storing hydrogen gas at room temperature.

Therefore, the second range of composition encompassed by the present invention is the range where the A/B ratio is between 0.45 and 0.35. As mentioned previously, A means  $(\text{Ca}_{0.4-x}\text{Mg}_{0.6-y}\text{M}_{x+y})$  and B means  $(\text{Ni}_{1-z}\text{T}_z)$ . This range corresponds to alloys of the  $\text{A}_2\text{B}_5$  type.

As discussed hereinabove, a  $\text{AB}_2$  phase with a cubic  $\text{C15}$  structure is formed when the A/B ratio is bigger than 0.45. When the A/B ratio is less

than 0.35, an  $AB_3$  phase with the  $PuNi_3$  structure is formed. However, when the A/B ratio is in the range of 0.35-0.45, a new  $A_2B_5$ -type phase with a crystallographic structure which has not yet been identified, is obtained. This new alloy is made by the same method as the one discussed previously, which comprises first preparing a powder by milling a mixture of elemental powders and/or pre-alloyed combinations of elemental powders (ex.: Ca, Mg, Ni,  $CaNi_2$ ,  $MgNi_2$  ...) in amounts sufficient to achieve the requested composition, and then annealing and/or sintering the so milled mixture at an elevated temperature of about 1000°C to form the requested hydrogen storage alloy.

Thus, the invention is based on the discovery of new hydrogen storage alloys of the  $A_2B_5$  type which contains Ca, Mg, Ni and other optional elements. These new alloys are capable of absorbing and desorbing hydrogen from the gas phase at ambient temperature with a flat plateau pressure and a storage capacity larger than 1.5 wt%.

These alloys may be prepared by a method comprising two steps.

The first one consists of preparing a powder by milling a mixture of elemental powders and/or pre-alloyed combinations of the elemental powders (ex.: Ca, Mg, Ni, Mm,  $CaNi_2$ ,  $MgNi_2$ ,  $MmNi_5$ , when  $M = Mm$ ) in respective amounts selected to obtain the requested alloy. The milling can be a conventional ball milling or a more intensive mechanical alloying. It can be carried out at room temperature or at high temperatures with or without anti-sticking agents and in various kinds of atmosphere.

The second step consists of annealing and/or sintering the milled powder at elevated temperatures in a crucible made of, for example, stainless steel, for a short period of time in an inert or reactive atmosphere. This is an essential step to achieve high reversible capacity and a flat plateau. The annealing

temperature should be higher than 900°C but not higher than 1080°C.

Once again, the invention is based on the discovery that mechanical alloying of elemental powders (such as Ca, Mg, Ni) and/or mixtures of intermetallic compounds (such as CaNi<sub>5</sub>, MgNi<sub>2</sub>) corresponding to the requested composition (Ca<sub>x</sub>Mg<sub>1-x</sub>)<sub>2</sub>Ni<sub>5</sub> leads to a highly disordered structure when the Mg/Ca ratio is between 0.33 and 1.67. The so-milled alloy can reversibly absorb and desorb hydrogen at room temperature. However, the reversible capacity is small and the slope of the PCT curves is very big.

10

The invention is also based on the discovery that a new A<sub>2</sub>B<sub>5</sub> type phase is formed when the mechanically alloyed (Ca<sub>x</sub>Mg<sub>1-x</sub>)<sub>2</sub>Ni<sub>5</sub> is annealed at temperature above 600°C. The formation range of this new phase depends on the Mg/Ca ratio and the (Ca + Mg)/Ni ratio. For a stoichiometric A<sub>2</sub>B<sub>5</sub> composition, the new phase no longer forms when the Mg/Ca ratio is lower than 0.3. If the Mg/Ca ratio is higher than 1.75, a large amount of MgNi<sub>2</sub> phase is formed and, as a result, the storage capacity is reduced. When the Mg/Ca ratio is set at 1.5, the new phase is formed when the (Mg + Ca)/Ni ratio is between 0.35 and 0.45.

20

The invention is further based on the discovery that when a thermal treatment is applied to this mechanically alloyed powder, substantial improvement in properties is achieved. Indeed, the hydrogen storage properties of the ball milled Ca-Mg-Ni are significantly improved by annealing the powder at temperatures higher than 900°C preferably around 1000°C or slightly higher for a short period of time, preferably 0.5 to 1 hour. Annealing at temperatures lower than 900°C does not improve the hydrogen storage properties very much.

30

It has also been discovered that further improvements are achieved by adding other elements to the basic elements used for preparing the alloys. Such an addition raises the plateau pressure and improves other hydrogen storage properties such as plateau slope and the long term stability .

5

#### Example II-1

(Ca<sub>0.375</sub>Mg<sub>0.625</sub>)<sub>2</sub>Ni<sub>5</sub> (x=0.025, y= -0.025, b=2, z=0) was synthesized in a SPEX high energy ball mill under an argon protective atmosphere. A Mg powder (> 99%, +100mesh), Ca granules (>99.5%, 2mm in size) and a  
10 Ni powder (>99.9%, -325mesh) were used as starting materials.

Isothermal annealing was performed in a tubular furnace under argon. The mechanically alloyed powder was sealed in a stainless steel crucible before annealing. The powder was heated to 1000°C at a heating rate of  
15 30°C/min, held at 1000°C for 1 hour and then cooled down to room temperature in the furnace.

Hydrogen absorption/desorption properties were measured by using an automatic Sievert's type apparatus. The annealed powder normally needs  
20 a mild activation treatment, such as a heating treatment to 200°C under vacuum followed by a cooling. EDX analysis showed that the Fe content in the end product is less than 0.2 at.%. The composition of the end product was close to the nominal composition. The activated alloy exhibited a relatively flat plateau and a high capacity

25

#### Example II-2

(Ca<sub>0.3125</sub>Mg<sub>0.625</sub>Mm<sub>0.0625</sub>)<sub>2</sub>Ni<sub>5</sub> (x= 0.0875, y= -0.025, M=Mm, x+y= 0.0625, b=2, z=0) was synthesized by ball milling of elemental powder  
30 blends. The alloy was annealed in the same manner as in Example II-1. This alloy had a storage capacity of 1.65wt%. Its plateau pressure was flat and

significantly raised as compared to that of Example II-1.

Example II-3 and subsequent

- 5 Other examples similar to examples II-1 and 2 were carried out. The results of these other examples are reported in the accompanying drawings (see Figs. II-1 to 12).

**3. ALLOYS OF THE AB<sub>5</sub> TYPE**

10

As aforesaid, when a is equal to 5, then the alloys according to the invention may also be of the formula:

15

when M and T are defined as above and

$$0.75 \leq b \leq 1.31,$$

$$-0.6 < x < 0.4,$$

$$-0.4 < y < 0.6,$$

20  $0 < x + y \leq 0.5,$  and

$$0 \leq z \leq 0.5.$$

Preferably:

$$-0.2 \leq x \leq 0.2,$$

25  $-0.2 \leq y \leq 0.2,$  and

$$0.1 \leq x + y \leq 0.4$$

- Alloys of the AB<sub>5</sub> type have already been studied in great detail (see references C, D, F, G, H). Some of them have even been recently patented for battery applications (see references I and J). For example, the patent identified as reference I discloses alloys of the formula (Mg<sub>1-a-b</sub>R<sub>1-a</sub>M<sub>1-b</sub>)Ni<sub>z</sub>
- 30

where  $3 \leq z \leq 3.8$ . Such corresponds to alloys AB where the ratio A/B is ranging between 0.263 and 0.33.

The alloys according to the invention as defined hereinabove are of the AB<sub>5</sub> type. LaNi<sub>5</sub>- and MmNi<sub>5</sub>- based AB<sub>5</sub> type alloys have been widely investigated as hydrogen storage materials (see reference 1 and 2). The La, Mm and Ni atoms can be substituted by many other elements to tailor the hydrogen storage properties for different applications (see reference 3). However, substitution of La by Mg in LaNi<sub>5</sub> has not been successful. A second phase with an approximate composition of LaMg<sub>1.85</sub>Ni<sub>5.26</sub> was found with a nickel-rich LaNi<sub>5+x</sub> main phase in a melt casting Mg<sub>0.1</sub>La<sub>0.9</sub>Ni<sub>5</sub> sample (see reference 4). The hydrogen storage capacity was reduced due to the formation of this second phase.

CaNi<sub>5</sub> intermetallic compound represents a category of low cost hydrogen storage materials with a storage capacity up to 1.9wt.% (see references 5 to 7). However, little attention has been paid so far to such a system, probably due to its well-known bad cycling stability (see reference 8). Improvement of the hydrogen storage properties of CaNi<sub>5</sub> by substitution of Ca or Ni with other elements has been tried (see references 5 to 8; A and K). Ternary Ca<sub>x</sub>Mm<sub>1-x</sub>Ni<sub>5</sub> alloys were produced by melt casting and were also investigated (see reference 5). Mm substitution for Ca can raise the plateau pressure of CaNi<sub>5</sub>. However, the plateau slope is big for the as-cast ternary alloys due to segregation. Annealing at elevated temperatures (> 1000°C) can reduce the slope to some extent. Previous works made by the present inventors have shown that CaNi<sub>5</sub> and Mm or Zn-substituted CaNi<sub>5</sub> type alloys with relatively flat plateau can be produced by mechanical alloying followed by an annealing treatment at low temperatures (640C) (see reference L).

Substitution of Mg for Ca in a  $\text{CaNi}_5$  structure has also been investigated. The reported results show that the  $\text{Ca}_{1-x}\text{Mg}_x\text{Ni}_5$  does not extend homogeneously beyond  $x=0.06$  (see reference A).

- 5 The invention is based on the discovery that slight substitution of Mg in the  $\text{CaNi}_5$  destroys the  $\text{AB}_5$  structure, and a mixture of  $\text{AB}_3$  and free nickel is formed. The hydrogen storage capacity is also reduced. However, when the alloy of the  $\text{AB}_5$  type containing Mg comprises more than 3 elements, the solubility limit can be extended and the plateau can be tailored by the Mg  
10 content. The plateau slope is also small and the reversible hydrogen storage capacity is bigger in comparison to ternary Ca-Mm-Ni  $\text{AB}_5$  type alloys.

Thus, the present invention provides new hydrogen storage alloys of the  $\text{AB}_5$  type, which contains Ca, Mg, Ni and M. These alloys are capable of  
15 absorbing and desorbing hydrogen from a gas phase at ambient temperature with a flat plateau pressure and a storage capacity larger than 1.3wt. %.

These new alloys may be prepared by a method similar to those already disclosed, which comprises two steps.

20

The first step consists of preparing a powder by milling a mixture of elemental powders and/or pre-alloyed combination of the elemental powders (ex.: Ca, Mg, Ni, Mm,  $\text{CaNi}_2$ ,  $\text{MgNi}_2$ ,  $\text{MmNi}_5$ , when  $M = \text{Mm}$ ) in respective amounts selected to obtain the requested composition. The milling can be  
25 a conventional ball milling or a more intensive or mechanical alloying which can be carried out at room temperature or at high temperatures with or without anti-sticking agents and in various kinds of atmosphere.

The second step consists of annealing and/or sintering the mechanically  
30 alloyed powder at elevated temperatures in a crucible made of, for example, stainless steel for a short period of time in an inert or reactive atmosphere.

This is an essential step to achieve high reversible capacity and a flat plateau. The annealing temperature should be higher than 800°C but not higher than 1100°C.

- 5 Once again, the invention is based on the discovery that mechanical alloying of elemental powders (such as Ca, Mm, Ni) and/or mixtures of intermetallic compounds (such as  $\text{CaNi}_5$ ,  $\text{MmNi}_5$ ) corresponding to the requested composition  $\text{Ca}_x\text{Mm}_{1-x}\text{Ni}_5$  leads to a nanocrystalline  $\text{AB}_5$  type structure. The so-milled alloy can reversibly absorb and desorb hydrogen at room  
10 temperature. However, the reversible capacity is small and the slope of the PCT curves is very big.

- The invention is also based on the discovery that when a thermal treatment is applied to this mechanically alloyed powder, substantial improvement in  
15 properties is achieved. Indeed, the hydrogen storage properties of the mechanically alloyed Mg-Ca-Ni are substantially improved when the powder is annealed at temperatures higher than 800°C typically at 1000°C or slightly higher, for short period of time, preferably 0.5h-1h. Annealing at temperatures lower than 800°C does not improve the hydrogen storage  
20 properties very much.

- It has also been discovered that further improvements are achieved by adding other elements (M) to the basic elements used for preparing the alloys. Such an addition raises the plateau pressure and improves other  
25 hydrogen storage properties such as plateau slope and the long-term stability while keeping predominantly the  $\text{AB}_5$ -type structure.

Example III- 1: Compound according to the prior art made by the method according to the invention.

30

$\text{Mm}_{0.4}\text{Ca}_{0.6}\text{Ni}_5$  ( $x=0$ ,  $y=0$ ,  $b=1$ ,  $z=0$ ) was synthesized in a SPEX high

energy ball mill under an argon protective atmosphere. A Mm powder (>99%, + 100mesh), Ca granules (>99.5, ~2mm in size) and a Ni powder (<99.9%, -325mesh) were used as starting materials.

- 5 Isothermal annealing was performed in a tubular furnace under argon. The mechanically alloyed powder was sealed in a stainless steel crucible before annealing. The powder was heated to 1000°C at a heating rate of 30°C/min, held at 1000°C for 1 hour and then cooled down to room temperature in the furnace.

10

Hydrogen absorption/desorption properties were measured by using an automatic Sievert's type apparatus. The annealed powder normally needs mild activation treatment, such as a heating treatment to 200°C under vacuum followed by a cooling. EDX analysis shows that the Fe content in  
15 the end product is less than 0.3 at.%. The composition of the end product was close to the nominal composition. The activated  $\text{Mm}_{0.4}\text{Ca}_{0.6}\text{Ni}_5$  alloy exhibited a relatively flat plateau and a high capacity.

Example III-2: Compound according to the invention made by the method  
20 according to the invention

$(\text{Mm}_{0.333}\text{Ca}_{0.5}\text{Mg}_{0.167})_{1.2}\text{Ni}_5$  ( $\text{M} = \text{Mm}$ ,  $x = 0.067$ ,  $y = 0.1$ ,  $x + y = 0.167$ ,  $b = 1.2$  and  $b/5 = 0.24$ ,  $z = 0$ ) was synthesized by mechanical alloying of elemental powder blends. The alloy was annealed in the same manner as in Example  
25 III-1. This alloy had a hydrogen storage capacity of 1.45wt.%. The plateau pressure and reversible hydrogen storage capacity were significantly improved in comparison to those of the prior art alloy  $\text{Ca}_{0.6}\text{Mm}_{0.4}\text{Ni}_5$ .

Example III-3: Compound according to the invention made by the method  
30 according to the invention:

( $Mm_{0.333}Ca_{0.417}Mg_{0.25}$ ) $_{1.2}Ni_5$  ( $M = Mm$ ,  $x = 0.067$ ,  $y = 0.183$ ,  $x + y = 0.25$ ,  $b = 1.2$  and  $b/5 = 0.24$ ,  $z = 0$ ) was synthesized by mechanical alloying of elemental powder blends. The alloy was annealed in the same manner as in  
5 Example III-1. This alloy had a hydrogen storage capacity of 1.4wt.%. The plateau pressure was flat and even higher than the one of Example III-2.

Example III-4 and subsequent

- 10 Other examples similar to those of Examples III-2 and 3 were carried out. The results of these other examples are reported in the accompanying drawings (see Figs. III-1 to 11).

CLAIMS

1) An alloy of the general formula:

5

where:

M is at least one metal selected from the group consisting of Y, Ce, La,  
10 Pr, Nd, Th, Nd, Ti, V, Zr, Ta, Hf, Sr, Ba and Misch metals;

T is at least one element selected from the group consisting of Al, Zn,  
Cu, Fe, Co, Mn, Cr, Mo, W, Si, Ga, Ge, In, Sn, Ag, C and B;

a is an integer equal to 2 or 5;

z is a number ranging from 0 to 0.5, and

15 when a is equal to 2, then b, c, d, e are numbers selected so that:

$$0.9 \leq b \leq 1.1$$

$$c = 0.4 - x,$$

$$d = 0.6 - y, \text{ and}$$

$$e = x + y, \text{ with}$$

20  $-0.5 \leq x < 0.4$

$$-0.4 < y \leq 0.5 \text{ and}$$

$$x + y > 0;$$

when a is equal to 5, then b, c, d, e are numbers selected so that

either

25  $1.75 \leq b \leq 2.25$

$$c = 0.4 - x,$$

$$d = 0.6 - y, \text{ and}$$

$$e = x + y, \text{ with}$$

$$-0.4 \leq x \leq 0.2,$$

30  $-0.2 \leq y \leq 0.4, \text{ and}$

$$x + y \geq 0$$

or

$$0.75 \leq b \leq 1.31,$$

$$c = 0.6 - y,$$

$$d = x + y, \text{ and}$$

$$5 \quad e = 0.4 - x, \text{ with}$$

$$-0.6 < x < 0.4,$$

$$-0.4 < y < 0.6, \text{ and}$$

$$0 < x + y \leq 0.5.$$

- 10 2) An alloy as claimed in claim 1, wherein said alloy is of the formula:

where M and T are defined as in claim 1 and

$$15 \quad 0.9 \leq b \leq 1.1,$$

$$-0.5 \leq x < 0.4,$$

$$-0.4 < y \leq 0.5,$$

$$x + y > 0, \text{ and}$$

$$0 \leq z \leq 0.5.$$

20

- 3) An alloy as claimed in claim 2, wherein:

$$-0.1 \leq x \leq 0.25 \text{ and}$$

$$-0.1 \leq y \leq 0.15.$$

- 25 4) An alloy as claimed in claim 1, wherein said alloy is of the formula:

where M and T are defined as claimed in claim 1 and

$$30 \quad 1.75 \leq b \leq 2.25,$$

$$-0.4 \leq x \leq 0.2,$$

$$-0.2 \leq y \leq 0.4,$$

$$x + y \geq 0, \text{ and}$$

$$0 \leq z \leq 0.5.$$

5

5) An alloy as claimed in claim 4, wherein:

$$-0.1 \leq x \leq 0.1, \text{ and}$$

$$-0.1 \leq y \leq 0.2.$$

10

6) An alloy as claimed in claim 4 or 5, wherein Mg and Ca are present in a Mg/Ca ratio ranging between 0.5 and 2.

7) An alloy as claimed in claim 6, wherein the Mg/Ca ratio is ranging  
15 between 1.5 and 1.75.

8) An alloy as claimed in claim 1, wherein said alloy is of the formula:

20

where M and T are defined as in claim 1 and

$$0.75 \leq b \leq 1.31,$$

$$-0.6 < x < 0.4,$$

$$-0.4 < y < 0.6,$$

25  $0 < x + y \leq 0.5, \text{ and}$ 

$$0 \leq z \leq 0.5.$$

9) An alloy as claimed in claim 8, w herein:

$$-0.2 \leq x \leq 0.2,$$

30  $-0.2 \leq y \leq 0.2, \text{ and}$

$$0.1 \leq x + y \leq 0.4.$$

10) An alloy as claimed in any one of claims 1 to 9, wherein said alloy is a single phase alloy.

5

11) An alloy as claimed in any one of claims 1 to 9, wherein said alloy is a multiphase alloy.

12) A method for preparing an alloy as claimed in any one of claims 1 to 10 11, comprising the step of:

- milling a mixture of elemental powders and/or pre-alloyed combination of elemental powders of Ca, Mg, M, Ni and T in relative amounts corresponding to those found in the requested alloy, and
- 15 - annealing and/or sintering the so-milled mixture of powders at a temperature higher than 800°C to obtain the requested alloy.

13) Use of an alloy as claimed in any one of claims 1 to 11 or prepared as claimed in claim 12 for reversibly absorbing hydrogen from a gas phase.

## INTERNATIONAL SEARCH REPORT

International Application No

PCT/CA 03/00058

A. CLASSIFICATION OF SUBJECT MATTER  
 IPC 7 C22C19/03 C01B6/00 H01M4/38

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)  
 IPC 7 C22C C01B H01M

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data, PAJ

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	EP 0 892 451 A (TOKYO SHIBAURA ELECTRIC CO) 20 January 1999 (1999-01-20) cited in the application	1,2, 10-13
A	page 3, line 25 - line 28 page 4, line 23 - line 29 page 11, line 23 - line 28 page 26, line 3 - line 7 page 65, line 36 - line 45 example 146; table 18	3
A	PATENT ABSTRACTS OF JAPAN vol. 2000, no. 06, 22 September 2000 (2000-09-22) -& JP 2000 080429 A (TOSHIBA CORP), 21 March 2000 (2000-03-21) abstract example 11; table 1 example 21; table 3	1-3, 10-13
	--- -/-	

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

## \* Special categories of cited documents:

\*A\* document defining the general state of the art which is not considered to be of particular relevance

\*E\* earlier document but published on or after the international filing date

\*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

\*O\* document referring to an oral disclosure, use, exhibition or other means

\*P\* document published prior to the international filing date but later than the priority date claimed

\*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

\*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

\*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

\*Z\* document member of the same patent family

Date of the actual completion of the international search

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/CA 03/00058

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
2. ☒ Claims Nos.: 1(part), 8,9  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
  
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
  
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
  
3. ☒ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:  
1-7, 10-13
  
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☒ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 1(part), 8,9

The AB2 alloy in claim 1 relates to an extremely large number of possible alloys. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the alloys claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the AB2 type hydrogen storage alloys according to the examples in the description (and figures ).

This is also the case for the A2B5 alloy in claim 1.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

## 1. Claims: 1,2,3,10-13

The first alternative of claim 1 relates to an alloy of the general formula:  $(Ca_c Mg_d M_e)_b (Ni_{1-z} T_z)_a$  where:

M is at least one metal selected from the group consisting of Y, Ce, La, Pr, Nd, Th, Nd, Ti, V, Zr, Ta, Hf, Sr, Ba and Misch metals;

T is at least one element selected from the group consisting of Al, Zn, Cu, Fe, Co, Mn, Cr, Mo, W, Si, Ga, Ge, In, Sn, Ag, C and B;

a is an integer number equal to 2;  
z is a number ranging from 0 to 0.5, and  
b,c,d,e are numbers selected so that:

$$\begin{aligned} 0.9 &\leq b \leq 1.1 \\ c &= 0.4 - x \\ d &= 0.6 - y \\ e &= x + y \\ -0.5 &\leq x < 0.4 \\ -0.4 &< y \leq 0.5 \\ \text{and } x+y &> 0 \end{aligned}$$

## 2. Claims: 1, 4-7

The second alternative of claim 1 relates to an alloy of the general formula:  $(Ca_c Mg_d M_e)_b (Ni_{1-z} T_z)_a$  where:

M is at least one metal selected from the group consisting of Y, Ce, La, Pr, Nd, Th, Nd, Ti, V, Zr, Ta, Hf, Sr, Ba and Misch metals;

T is at least one element selected from the group consisting of Al, Zn, Cu, Fe, Co, Mn, Cr, Mo, W, Si, Ga, Ge, In, Sn, Ag, C and B;

a is an integer number equal to 5;  
z is a number ranging from 0 to 0.5, and  
b,c,d,e are numbers selected so that:

$$\begin{aligned} 1.75 &\leq b \leq 2.25 \\ c &= 0.4 - x \\ d &= 0.6 - y \\ e &= x + y \\ -0.4 &\leq x \leq 0.2 \\ -0.2 &\leq y \leq 0.4 \\ \text{and } x+y &\geq 0 \end{aligned}$$

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

## 3. Claims: 1,8,9

The third alternative of claim 1 relates to an alloy of the general formula:  $(Ca^c Mg^d M^e)_b (Ni^{1-z} T^z)_a$  where:

M is at least one metal selected from the group consisting of Y, Ce, La, Pr, Nd, Th, Ti, V, Zr, Ta, Hf, Sr, Ba and Misch metals:

T is at least one element selected from the group consisting of Al, Zn, Cu, Fe, Co, Mn, Cr, Mo, W, Si, Ga, Ge, In, Sn, Ag, C and B;

a is an integer number equal to 5;  
z is a number ranging from 0 to 0.5, and  
b, c, d, e are numbers selected so that:  
 $0.75 \leq b \leq 1.31$   
 $c = 0.6 - y$   
 $d = x + y$   
 $e = 0.4 - x$

$-0.6 < x < 0.4$   
 $-0.4 < y < 0.6$   
and  $0 < x+y \leq 0.5$
